PAGE: _____

* Built in Datatypes :-

Text type : str.
Numeric Types : int, float, complex
Sequence Types : list, tuple, range
Mapping Types : dict.
Set Types : set, frozenset
Boolean Type : bool
Binary Types : bytes, bytearray, memoryview
None Type : NoneType

Functions :

```
def function ():
    print ("abcd")

function ()
```

Arguments :

```
def function (fname) :
    print ( fname + "abcd")

function ("Email")
function ("Tobias")
function ("Linus")
```

* Arbitrary Arguments *args

```
def function (*sports)
    print ("Fav sports is" + sports[1])

function ("cricket", "volleyball", "abcd")
```

DATE: / /
PAGE:

Key-word Arguments :

```
def function ( child 3, child 2, child 1)
  print ( " The youngest child is " + child 2)

function (child 1 = "Naveen", child 2 = "Vishwa"
          child 3 = "venbi")
```

Pass Statement :

```
def functions ( ) :
  pass                    // Empty purpose.
```

Lambda :

A lambda function can take any no.of arguments, but can only have one expression.

Syntax :

```
lambda arguments : expressions
```

Ex :

Add 10 to arguments a, and return the result :

```
x = lambda a : a+10
print (x(5)).
```

Lab -2

DATE: 10, 11, 23.
PAGE:

1) Using if-else statement :

```
age = int (input (" Enter your age : "))
if age < 0 or age > 150 :
    print (" Enter a valid age ! ")
else :
    if age < 13 :
        print (" You are a child ! ")
    elif age < 20 :
        print (" You are a teenager ! ")
    elif age < 35 :
        print (" You are an adult ! ")
    elif age < 60 :
        print (" You are a middle aged person
    else :
        print (" You are a senior citizen ! ")
```

Output :

```
Enter your age : 30.
You are an adult.
```

DATE: __/__/__
PAGE:

2) Find power of n.

```
x, n = input("Enter the base and power:").split()
x = int(x)
n = int(n)
print(x, "to the power of", n, "is", pow(x,n))
```

Output: 2 3

3 to the power of 2 is 8.

DATE: __/__/__
PAGE:

3) Reversing

```
num = int(input("Enter any integer:"))
sum = 0
while num>0:
    sum = 10*sum + num%10
    num //= 10
print("The number in reverse order is:",sum
```

Output: 2521

The number in reverse order is = 1252.

8

4) Pattern (1, 22, 333 - - -)

```
n = int(input("Enter length of pattern :"))
for i in range(n):
    for j in range(i+1):
        print(i+1, end="")
print(end="\n")
```

Output: 3

1, 22, 333.

Lab-3.

1) Implement Tic-Tac-Toe Game

```

8- Puzzle Game using DFS. Algorithm:

problem: Given a 3×3 board with 8 tiles, where every tile has a number from 1 to 8 and one empty space called as 0. The objective is to slide the tiles adjacent to empty space to match the final configuration.

Algorithm:

1. Start
2. Start from given configuration by generating all child nodes of it
3. Now select the child node by using least cost function where least cost = no. of moves made + number of tiles in non fin configuration
4. Now keep on repeating step 2 and 3 until a final state is reached where we cannot generate any child further
5. Now check if this configuration matches the required one.
6. Return the answer.
7. Stop.

checked

Algorithm:

1) Create the initial state & goal state for the problem. In A*, the heuristics is considered, lower heuristic node is considered in each step.
   fvalue = hvalue + path cost

2) Initially expand the node, find the location of empty & generate the node
   Calculate heuristic function value
   $f(x) = h(x) + g(x)$

3) Maintain 2 list namely 'open' & 'close' The nodes (states) generated are stored in open list, sort using $f(x)$ values. The explored nodes are stored in close list & removed from open.

4) The goal is reached when $h(x) = 0$, implies that all tiks are in correct position.

$x^2 + |z| + y^3$

Vaccum cleaner Agent Simulation Program

Algorithm:

1) Define Goal state and cost:
   Initialize the goal state representing the cleanliness status of rooms A and B.

2) Take User input for Vaccum's location and Room status.

3) Execute Actions Based on location and status

4) Perform Actions Based on Status of Other Room.

5) Display the final Results.
   Display the final goal state indicating the cleanliness status of room A and B.

Code:-

```
def vaccum_world():
    goal_state = {'A':'0', 'B':'0'}
    cost = 0

    location_input = input("Enter Location of vaccum")

Implementation of unification in FO Logic.

DATE: / /
PAGE:

19/1/24

Unification Algorithm:

Step 1: If x_1 or x_2 is a variable or constant, then:

a) Else If x_1 is a identical variable, then return NIL.

b) Else if x_1 is a variable,
   a, then if x_1 occurs in x_2, then return FAILURE
   b. Else return {(x_2/x_1)}.

c) Else if x_2 is a variable,
   a. If x_2 occurs in x_1, then return FAILURE,
   b. Else return {(x_1/x_2)}.

d) Else return FAILURE.

Step 2: If the initial Predicate symbol in x_1 and x_2 are not same, then return FAILURE.

Step 3: If x_1 and x_2 have a different number of arguments, then return FAILURE.

Step 4: Set substitution set (SUBST) to NIL.

Step 5: For i=1 to the number of elements in x_1.

a) Call unify function with the ith element of x_1 and ith element of x_2, and put the result into S.

b) If S = failure then returns failure

c) If S ≠ NIL then do,

   a. Apply S to the remainder of both L1 and L2.

   b. SUBST = APPEND (S, SUBST).

Step 6: Return SUBST.

Code:

```
import re

def getAttributes(expr):
    expr = expr.split("(")[1:]
    expr = "(".join(expr)
    expr = expr[:-1]
    expr = re.split("?<!\\(.),(?!.\))", expr)
